

The reactor loop

Inline Callbacks

The thread of control.  
Time is going downwards.

The generator function is called  
and the first inline callback runs.

The generator yields a  
deferred here. Control  
returns to the reactor.

During this period unrelated  
callbacks and deferreds  
may fire.

The deferred yielded above  
is fired here

The generator resumes  
and the second inline  
callback runs.
